

Usability Design Project - Submission 1 Rubric

Rubrics provide guidelines for performance expectations. Actual grading may vary to reflect quality and quantity of submitted work, adherence to briefs and application of learning from unit content.

	Below Expectations <i>Partly correct, major issues.</i>	Satisfactory Attempt <i>Generally correct, several notable issues.</i>	Developing Skills <i>Mostly correct, some notable issues.</i>	Strong Performance <i>Mostly correct, only minor issues.</i>	Exceptional Performance <i>Highly nuanced work, very minor issues.</i>
Group: Overall Document (10%)					
Written Quality	Writing has frequent errors with unclear expression of ideas. Sequence of deliverables is confusing.	Writing has some errors that impact clarity of communication. Sequence of deliverables is mostly correct.	Writing has some errors, but communication of ideas is still clear. Writing could be more direct and concise. Sequence of deliverables is correct.	Writing is free of notable error, clear communication with professional tone. Some writing could be more direct and concise. Sequence of deliverables is correct.	Writing is free of error and highly professional. Writing is concise and direct. Structure provides clear flow of ideas through all deliverables.
Visual Quality	Some formatting is present, but lacking clearly defined headings and paragraphs. Minimal attempt at visual design of document.	Heading styles represent structure with some inconsistency. Document visual design is very plain with notable inconsistencies between sections.	Consistent heading styles reflect document structure. Document has professional visual design applied with some inconsistencies.	Consistent heading styles reflect document structure. Document has professional visual design applied with only minor issues with content presentation.	Visual presentation of the document is consistent and highly professional (ie. title page template, matching graphical style throughout document).
Group: Questionnaire and Analysis (47%)					
Questionnaire - Structure	Questionnaire has incorrect number of questions - somewhat less or more than required. Questions are not structured using required categories.	Questionnaire has correct number of questions. Required question categories are present with several questions incorrectly categorised.	Questionnaire has correct number of questions. Required question categories are present with few questions incorrectly categorised.	Questionnaire has correct number of questions. Required question categories are present with all questions correctly categorised.	Questionnaire has correct number of questions. Questions correctly categorised. Design of questionnaire is professional and very user-friendly.
Questionnaire - Question Design	Several individual questions are unclear in wording and answer formats. Frequent violations of recommended best practices.	Some questions or answer formats are confusing or inappropriate for the project. Limited variety or inappropriate implementation of answer formats for some questions.	Most questions and answer formats are clear but some have notable issues. Some variety of answer types with issues in implementation.	All questions are clear and a variety of answer formats correctly implemented. Questions are consistently relevant and user-centred.	All questions are clear and a variety of answer formats correctly implemented. Questions are all relevant and user-centred, with quantitative and qualitative data collection.
Report - Questionnaire Distribution and Participant Sampling	A vague description of how questionnaire was distributed. Participant selection criteria are not realistically considered.	Questionnaire distribution method is described clearly. Participant selection is vaguely described.	Questionnaire distribution method is described well. Participant selection has some consideration of formal sampling methods.	Questionnaire distribution method is described well. Participant sampling method correctly explained with realistic and specific reasoning.	Questionnaire distribution method clearly reasoned. Participant sampling method accurately explained with specific reasoning and realistic impact on data quality.
Report - Data Analysis	Data analysis makes limited use of questions. Analysis is mostly superficial description of data, lacking deeper insight.	Data analysis makes use of most questions. Analysis leans more to description of data, some new insights but meaning is vague.	Data analysis makes use of all questions. Analysis produces new insights but some could be more user-centric. Limited qualitative data analysis of cross-analysis performed.	Data analysis uses all questions with user-centric insights in almost all cases. Qualitative analysis is present and a few instances of cross-analysis.	Data analysis uses all questions with user-centric insights in all cases. Several instances of qualitative and cross-analysis. Findings produce meaningful observations about users.
Report - Further Research	Possible further research is mentioned, but unclear if actual research was done. May focus more on general domain than users.	Further research is present but could be more relevant to either domain or users. Unclear how the research addresses a specific gap in the data.	A vague gap in the data is identified. Further research may be tangentially relevant to the data gap or project context.	A specific gap in the data is identified. Further research has been conducted to supplement the analysis.	A specific gap in the data is identified. Further research done using a highly relevant and appropriate source, producing new useful findings.
Report - Data Collection and Presentation	Low number of responses collected. Visual representation of data is present but not integrated into analysis and for few observations only. Raw response data provided, but not all values readable.	Good number of responses collected. Visual representation of present within the analysis for several observations, but some inappropriate chart types. Raw response data provided but not all values readable.	Good number of responses collected. Visual representation of data within the analysis covers most data, some issues with clarity of visuals. Raw response data is visible in full.	High number of responses collected. Visual representation of data within the analysis covers all questions, some limited depiction of cross-analysis. Raw response data is visible in full.	High number of responses. Visual representation of data within the analysis is appropriate and covers all questions, including qualitative and cross-analysis. Raw response data is visible in full.

Individual: Persona, User Stories and Requirements (43%)					
Persona - Structure and Formatting	Persona has minimal use of information categories. Persona has very minimal attempt at formatting and visual presentation of information.	Persona has basic information categories but limited extended fields, some used incorrectly. Appropriate template is used, but notable inconsistency of design implementation.	Persona has basic information categories and some useful extended fields, some minor issues. Appropriate template is used with minor inconsistency of design implementation.	Persona has all basic information several useful extended fields. An appropriate template is used, presented professionally. Visual presentation of information has some minor issues.	Persona has all basic categories several useful extended fields. An professional design is applied with high level of visual appeal and useful visual representation of information.
Persona - Narrative and Empathy	Persona lacks humanity, depicting the person as a collection of analysis observations. Several aspects are not realistic (e.g. photo, information) or not user-centric.	Persona loosely captures humanity (e.g. some storytelling in a biography) but lacks connection between details to build empathy. Some needs and frustrations are not user-centric.	Persona captures humanity with some details in a few different information categories building empathy. Needs and frustrations have superficial link to persona's narrative.	Persona has sufficient storytelling and links between information to feel like a real person. Realistic needs and frustrations. Minor detail may be inconsistent or not user-centric.	Persona storytelling combines information to feel like a highly believable person. Needs and frustrations are relevant and relatable. All detail is user-centric and easy to empathise with.
Persona - Explanation of Relevance to Data	Persona's relevance to data was informally addressed. Links to data analysis could be vaguely inferred.	Persona's relevance to data mentioned ideas from the data analysis, but lack specificity in reasoning. May have fewer than the required number of links.	Persona's relevance to data included an appropriate number of specific links to data observations. Reasoning was limited or mostly subjective.	Persona's relevance to data had an appropriate number of clearly identified values from the data. Some reasoning was given for why each value was selected.	Persona's relevance to data was explained an appropriate number of clearly identified values from the data. Each link was explained with reasoning for why it is important to the persona and project.
User Stories - Structure and Relevance	User stories are present but are incorrectly structured or lack relevance to the project.	User stories correctly structured, but several aspects are not user-centric.	User stories are correctly structured but include some develop-centric description of app feature.	User stories are correctly structured and provide insight into persona desires. 1 story may have limited issues with project relevance or developer-centric detail.	Both user stories are correctly structure and written as highly user-centric statements. Both stories have strong relevance to the persona and project domain.
User Stories - Prioritisation and Justification	User stories have been categorised using MoSCoW but justification explained relevance instead of providing reason for the assigned priority.	User stories have been categorised using MoSCoW but with a superficial or subjective justification of the assigned priority.	User stories categorised using MoSCoW in order from most important to least, justification has some vague consideration of data collection.	User stories categorised using MoSCoW in order from most important to least. Justification refers to a specific observation from the data.	User stories categorised using MoSCoW in order from most important to least, justification objectively considers importance to the persona and potential broader impact based on data.
New User Requirements	New requirements are present but not defined as high-level user requirements, or have too much overlap with existing requirements.	New user requirements are defined with too much low-level detail. Requirements have some overlap with each other or existing requirements.	New user requirements are defined as high-level statements. Could be slightly more user-centric. Both are unique and relevant to the project domain.	New requirements are high-level and user-centric. The requirements are unique and highly relevant to the project domain.	New requirements are high-level and highly user-centric. Both requirements are unique and relevant. Both have an easily observable relationships to the data analysis outcomes.
