

Usability - S2 2025

Submission 3 - High-Fidelity Prototype and Report (30%, Group Work with Individual Component)

Overview

Consolidate individual work from Submission 2 and decide how your group will integrate ideas into a single high-fidelity prototype. After developing the prototype, individually evaluate its usability based on formal usability heuristics.

There are three parts to this assessment task:

- Part 1: High-Fidelity Prototype
- Part 2: Written Report
- Part 3: Individual Heuristic Evaluation

Part 1: High Fidelity Prototype (10%)

Your group will work collaboratively to design a high-fidelity interactive prototype based on ideas from your individual low-fidelity prototypes from Submission 2. Share your sketches from Submission 2 and discuss their benefits and limitations to decide on a final design concept (target user requirements, feature implementations and visual design style).

Implement the design as a high-fidelity prototype using **Figma** (<https://www.figma.com/>). Your group will also write a short report that documents important usability theory implemented in the prototype.

Prototype requirements:

Figma is the only prototyping tool that will be accepted for this deliverable. Use Figma with your education verified account (refer to Applied class 9).

- You will produce an interactive prototype with a specific number of different screens.
 - The total number of screens will be equal to **2 screens per group member** (e.g., 3 members = 6 screens, 4 members = 8 screens, etc.).
 - A **screen** is a frame that shows a full device screen layout where the majority of elements are different to other frames.
 - One of the screens must be the app's **home screen**.
 - You can use overlay menus and pop-up dialogs. Small frames used as overlays are not counted in your screen limit.
 - Duplicated screens with minor modifications to show a different state of the same screen are not counted in your screen limit.

- Do not include low value screens that don't support important user goals. For example, login screens - assume the user is already logged in.
- Group members should work collaboratively on all screens in Figma. Group members should not work independently on different screens by themselves.
- The prototype must address **at least 2 different user requirements** (either defined in the project brief or proposed by group members in Submission 1).
- The prototype must be structured so that each user requirement has **at least 2 screens of depth** (as shown in the diagram below).

Prototype structure with a breadth of 2 requirements, each with a depth of 2 screens.

- Each screen should reflect a final version of the user interface design, including realistic text and image content, as well as fully implemented visual design style.
- You must implement interactive navigation to provide access to all screens for your chosen requirements. Click interactions within each screen should be present for UI elements such as buttons and menus when they are relevant to showing how chosen requirements function.
- You don't need to include animations or advanced scripted interaction such as updating variables, live data processing or calculations.

Downloaded images used in the prototype should have licences that allow commercial use for free. All images sourced online must be individually referenced in your report. Refer to our "[Acceptable Image Licences](#)" policy

Generative AI is only allowed for the creation of image assets to use as image content in your prototype. All images generated using AI must be individually referenced in your report with all prompts provided. Refer to our "[Use of Generative AI Tools](#)" policy.

Part 2: Written Report (10%)

Write a report that briefly explains how usability theory has been implemented into the prototype, including accessibility considerations. In your report you must include:

- An introduction that provides a brief overview of your project and lists the user requirements (2 or more) your group has selected to implement in your prototype (**up to 100 words introduction + list of user requirements**).
- Provide a clear image of each screen of the prototype. Label each screen with:
 - A heading with a unique name that describes the purpose of the screen.
 - A caption listing user requirement(s) implemented in the screen.
- Annotate each screen to highlight and label usability and accessibility features mentioned in theory explanations in the report. Do not include unnecessary annotations - each one must be specific and relevant to a written explanation.
- For each screen, provide a written explanation of 1 unique design guideline or principle that has been implemented. Don't discuss accessibility principles/guidelines, Norman's Principles or Nielsen's Heuristics (**up to 100 words per screen**).

Theory used in explanations must be from the following only:

- Best Practices for Interface Design (week 6)
- Navigation types and menu design guidelines (week 6)
- Visual design and gestalt principles (week 7)
- Ben Shneiderman's 8 Golden Rules (week 9)
- For the entire prototype, briefly explain 3 different accessibility guidelines implemented anywhere in the prototype. Your chosen guidelines must cover 3 principles: perceivable, operable and understandable (**up to 100 words per explanation, 300 words total**).

Remember that WCAG guidelines are more specific than WCAG principles, for example:

- Principle: 4. Robust
 - **Guideline: 4.1 Compatible**
 - Success Criterion: 4.1.1 Parsing

Part 3: Individual Heuristic Evaluation (10%)

Each group member will individually assess the usability of the **entire prototype** by conducting an **individual Heuristic Evaluation** that applies Nielsen's Heuristics.

For each of Nielsen's 10 heuristics, you will identify one example, which is either a compliance or a violation. You must identify **at least three violations** in your evaluation.

- Identify violations and present them in the following table format, including the heuristic rule number, evidence (cropped and annotated screenshots), severity ratings, and a recommendation to address the problem.

Heuristic Rule	Instance of Violation	Evidence	Severity Rating and Justification	Recommendation
<i>Rule number.</i>	<i>Briefly describe what you observed during testing</i>	<i>Insert a cropped and annotated screenshot.</i>	<i>Severity rating number and how it was decided.</i>	<i>Provide a very brief recommendation to fix the issue.</i>

Severity ratings must be a score between **1** and **4**. Your justification should demonstrate that you've taken into account the:

- **Frequency of occurrence:** Is it likely to be a common or rare issue?
- **Impact on users:** How does it impact user goals? Easy or difficult to resolve?
- **Persistence:** Does it need to be overcome once or repeatedly?

When evaluating individually, the frequency may be difficult to determine as you are not testing with a large number of users. You can still make judgments about how common a problem is likely to be, or if it occurs in many places in the prototype.

- For any heuristics that have not been violated, identify a compliance. Present your compliances in a separate table, including the heuristic rule number, evidence (cropped and annotated screenshots) and justification.

Heuristic Rule	Instance of Compliance	Evidence	Design Justification
<i>Rule number.</i>	<i>Briefly describe what you observed during testing.</i>	<i>Insert a cropped and annotated screenshot.</i>	<i>Justify the compliance by applying usability theory.</i>

Evaluations must include all 10 of Nielsen's heuristics. Any combination of compliances and violations is accepted as long as at least 3 violations are present.

Only identify one unique instance for each heuristic. If a heuristic is used more than once, only the first instance will be marked.

The same evidence cannot be used for multiple heuristics.

Format of the deliverables

You will submit a report document and a copy of your project file downloaded from Figma. You will also need to provide a link in your report for tutors to view your prototype online.

Set your Figma prototype's sharing settings to allow "anyone with the link" to edit your project. Tutors require editing privileges to test the prototype and check the version history.

If a tutor needs to request access to view or edit your prototype anytime after the submission deadline, a 5% late submission penalty will apply.

1 group member must upload the submission to Moodle as a single PDF file for your report and your Figma file (.fig). **Do not compress the files as a ZIP file.**

The PDF file should have the following structure:

- **Title Page**
- **Table of Contents**
- **Group Work: High-Fidelity Prototype**
 - Link to view your Figma prototype, with editing access for tutors.
 - ***Total number of unique screens is equivalent to 2 screens per group member.***
- **Group Work: Written Report**
 - Introduction with list of target user requirements.
 - Exported images of all prototype screens, with labels and annotations
 - Explanation of 1 design guideline implemented per screen.
 - ***Up to 100 words per explanation.***
 - Explanation of 3 accessibility guidelines implemented in the prototype
 - ***Up to 100 words per explanation, 300 words total.***
- **Individual Work: Heuristic Evaluation**
 - Heuristic violations table and heuristic compliances table.
 - ***All 10 Nielsen Heuristics must be addressed between the 2 tables.***
 - ***At least 3 of the heuristic instances must be violations.***
- **References**
 - Include references for assets used in the high-fidelity prototype that are not your own original work. This includes, but is not limited to:
 - Figma UI Kits
 - Downloaded images
 - AI generated images
 - Include references for supporting research cited in the report (if any).
- **Appendix**
 - Include any deliverables from previous submissions (personas / stories / low fidelity sketches) that were used or referred to in this submission.

Deliverables should be professionally formatted - present them as if you were giving them to a potential client.

The name of your submitted files should follow this format:

FIT5152-Sub3-Applied#-GroupName (e.g. **FIT5152-Sub3-Applied1-TeamRocket.fig** and **FIT5152-Sub3-Applied1-TeamRocket.pdf**).

Submission Due: Friday 24th October, at 11:55pm.

Assessment Policies

Plagiarism and academic integrity

Plagiarism occurs when students fail to acknowledge that the ideas of others are being used. This includes when:

- Other people's work is used in whole or part without citation/reference.
- Other people's work is paraphrased or modified without acknowledgement.
- AI-generated output is presented as your own work without acknowledgement.

It is your responsibility to [maintain academic integrity in your work](#) and understand the [procedures and penalties](#) that apply to intentional and unintentional breaches of integrity.

Acceptable Image Licences

For image assets sourced online, we prefer images that have open licences that specifically allow commercial use without requiring payment. This includes images in the Public Domain (no copyright), Creative Commons (copyrighted with permissive conditions for use) and other permissive licences that specifically allow commercial use without payment.

Examples of websites that have images with acceptable open licences:

- Photos: <https://commons.wikimedia.org/>, <https://pexels.com/>, <https://unsplash.com>
- Illustrations: <https://blush.design/categories>, <https://pixabay.com/illustrations/>
- Icons: <https://flaticon.com/>, <https://icons8.com/icons>, <https://thenounproject.com/>

Websites may use different licences for different images. You are responsible for verifying that an appropriate licence is present. If attribution is required for an image, an acknowledgement in your references is acceptable.

Use of Generative AI Tools

In this assessment, you may only use generative AI to generate images to use as visual content in prototypes (e.g., user profile pictures, product photos, etc.). Any use of generative AI must be acknowledged by specifying the tools and prompts used (see [Learn HQ](#)).

- Clearly identify the part of your work where Generative AI was used.
- Include a reference link to the AI tool that was used.
- Include the prompt that was entered to generate the output.
- Explain how you modified the original output before submission.

Use of Generative AI tools for other purposes and use of Generative AI tools without proper acknowledgement is a breach of academic integrity.

Submission of deliverables to Moodle

All assessed work must be uploaded to Moodle using the provided submission link. Where practicable, submissions will be scanned using a similarity checking tool, such as TurnItIn.

Submission of assessable work using other methods (email, Google Drive, etc.) will not be accepted unless specifically instructions to do so are provided in the assignment brief.

Links to view deliverables online are only acceptable if instructions in the brief specifically ask you to provide a link.

Late Submissions

Each day, or part thereof, that an assessment task is overdue, a penalty of 5% of the available total marks applies. Assessment tasks submitted more than seven days after the due date will receive a mark of zero and may not receive feedback.

Special consideration requests must be submitted using the [online extension request form](#). Submitting an application for an extension or special consideration does not guarantee that the extension will be approved, so must inform your group members and continue to work on your assessment for submission as soon as you are able to.
