

Usability Design Project - Submission 3 Rubric

Rubrics provide guidelines for performance expectations. Actual grading may vary to reflect quality and quantity of submitted work, adherence to briefs and application of learning from unit content.

	Below Expectations <i>Partly correct, major issues.</i>	Satisfactory Attempt <i>Generally correct, several notable issues.</i>	Developing Skills <i>Mostly correct, some notable issues.</i>	Strong Performance <i>Mostly correct, only minor issues.</i>	Exceptional Performance <i>Highly nuanced work, very minor issues.</i>
Group: Overall Document (10%)					
Written Quality	Writing has frequent errors with unclear expression of ideas. Sequence of deliverables is confusing.	Writing has some errors that impact clarity of communication. Sequence of deliverables is mostly correct.	Writing has some errors, but communication of ideas is still clear. Writing could be more direct and concise. Sequence of deliverables is correct.	Writing is free of notable error, clear communication with professional tone. Some writing could be more direct and concise. Sequence of deliverables is correct.	Writing is free of error and highly professional. Writing is concise and direct. Structure provides clear flow of ideas through all deliverables.
Visual Quality	Some formatting is present, but lacking clearly defined headings and paragraphs. Minimal attempt at visual design of document.	Heading styles represent structure with some inconsistency. Document visual design is very plain with notable inconsistencies between sections.	Consistent heading styles reflect document structure. Document has professional visual design applied with some inconsistencies.	Consistent heading styles reflect document structure. Document has professional visual design applied with only minor issues with content presentation.	Visual presentation of the document is consistent and highly professional (ie. title page template, matching graphical style throughout document).
Group: High-Fidelity Prototype (30%)					
Implementation of Requirements and Prototype Depth	User requirements are presented mostly with a single screen of depth. Significant focus on low-value screens lacking domain relevance.	Prototype has an inappropriate number of screens. High focus on a single requirement, with others lacking in depth.	Prototype has appropriate number of unique screens structured with appropriate depth. Little interactivity within each screen.	Prototype has appropriate number of unique screens structured with appropriate depth. Some interactivity depicted using overlays or alternative screen states.	Prototype has appropriate number of unique screens structured with appropriate depth. High degree of important functionality interactively depicted using overlays or alternative screen states.
Visual Fidelity, Visual Design and Navigation Design	The prototype has some low-fidelity content and UI elements. Visual design has significant issues or inconsistency. Several screens cannot be reached using navigation.	The prototype is mostly high-fidelity with notable instances of low-fidelity content or UI elements. Visual design implemented with inconsistency. All main navigation is functional, but some flows are broken or incorrect.	The prototype is high-fidelity with minor instances of low-fidelity content and occasional design inconsistency. All main navigation is functional, but some parts are unintuitive.	The prototype is high-fidelity in almost all areas. Visual design is professional and consistent. Navigation allows all screens to be reached with ease.	The prototype is high-fidelity in all areas. An visually appealing design style is applied with high level of consistency and attention to detail. Navigation allows all screens to be reached with ease.
Usability and Accessibility Design	The prototype has notable violations of usability principles. Multiple instances of varied accessibility problems.	The prototype has notable violations of usability principles. Screen designs are generally accessible with limited problems. An accessibility-specific feature is depicted superficially.	The prototype has few notable violations of usability principles. Screen designs have only minor general accessibility issues. Multiple accessibility-specific features are depicted superficially.	The prototype has minor violations of usability principles. Screen designs have generally high accessibility. An accessibility-specific feature is implemented with some interactive depiction of how the feature functions.	The prototype has no notable violations of usability principles. Screen designs have generally high accessibility. Multiple accessibility-specific features are implemented with some interactive depiction of how the feature functions.
Group: Report (30%)					
Annotated Prototype Screenshots	Screenshots of each prototype screen are present, but lacking annotations specific to theory explained in the report.	Annotated screenshots of each prototype screen are present, but relevant elements are not clearly identified to match the explanations.	Annotated screenshots are present for each prototype screen. Annotations are inconsistent with some not clearly identifying relevant elements and theory.	Screenshot are present for all prototype screens with specific and relevant annotations. A few annotations are inconsistent or have errors with applied theory.	Screenshot are present for all prototype screens with specific annotations. All annotations apply nominated theory correctly, identifying relevant elements only.
Usability Principles and Guidelines	Explanations had a significant number of incorrectly identified or duplicated theory names. Explanations were mostly superficial description of elements instead of reasoning.	Explanations had a few incorrectly identified or duplicated theory names. Explanations were mostly provided reasoning that was assertive or vague regarding application of theory.	Explanations identified theory names correctly but with some error in explanation. No duplication of theory. Some explanations have vague or assertive reasoning.	Explanations identified theory names correctly but with only minor error in explanation. No duplication of theory, wide variety used. A few explanations have vague or assertive reasoning.	Explanations identified theory correctly in all instances, may have rare minor error only. No duplication of theory, all theory categories addressed. Explanations have specific and objective reasoning.

Accessibility Principles and Guidelines	Accessibility was discussed using principles but no guidelines. Principles may be applied incorrectly. Descriptions of features given with very little reasoning.	Explanation of accessibility mostly relied on principles, limited or significantly incorrect identification of guidelines. Benefits vaguely discussed with limited recognition of exclusion.	Explanation of accessibility applies principles correctly, use of guidelines has instances that are categorically incorrect or lack relevance. General benefits discussed with some recognition of exclusion.	Explanation of accessibility applies principles correctly, use of guidelines has minor incorrectness. Specific user benefits discussed with only minor error in recognition of exclusion.	Explanation of accessibility applies principles correctly, consistently relevant guidelines applied. Specific user benefits discussed with recognition of exclusion. Success criteria are used and all are relevant.
Individual: Heuristic Evaluation (30%)					
Application of Heuristics	The heuristic evaluation tables contained all required columns, but low covered approximately half of the required heuristics. Compliances mostly supported by assertion.	The heuristic evaluation tables addressed almost all heuristics or had some duplication. Some instances applied incorrectly and with mostly superficial description. Compliances supported with generalised benefit.	The heuristic evaluation tables address all heuristics with no duplication. Some instances identified incorrectly or reasoned vaguely. Compliances mostly supported with practical reasoning.	The heuristic evaluation tables address all heuristics with no duplication. A few instances have minor error. Specific reasoning was given. Additional theory used to support some compliances.	The heuristic evaluation tables address all heuristics with no duplication. All instances described correctly. Specific reasoning was given. All compliances correctly supported with additional theory.
Screenshot Evidence	Some evaluation items are missing screenshots or some screenshots don't match the description. Annotations are missing or not relevant.	A screenshot is provided for most compliances and violations. Annotations are only present for a few screenshots.	An appropriate cropped screenshot is provided for each compliance and violation. Annotations are missing or too vague for a few images.	An appropriate cropped screenshot is provided for each compliance and violation. Annotations are present in all images, but some are unclear of inaccurate.	An appropriate cropped screenshot is provided for each compliance and violation. Specific relevant elements are clearly and accurately annotated in all images.
Severity Rating Justifications	Severity rating scores are given for all violations, but justification is vague or entirely subjective.	Severity ratings given for all issues, mostly with general justification of the final rating only or a breakdown of the scores given without reasoning.	Severity ratings given for all issues, justifications mostly apply 1 severity rating factor correctly.	Severity ratings given for all issues, justifications mostly apply 2 severity rating factors correctly.	Severity ratings given for all issues, justifications apply all 3 severity rating factors correctly.
Recommended Solutions	Recommendations suggest very vague or unfeasible solutions for most issues.	Recommendations suggested are relevant but mostly explained without specific changes or benefits.	Recommendations will resolve the issues and identify specific changes that should be made. Reasoning mostly reapplies the nominated heuristic only.	Recommendations are appropriate solutions of specific changes that should be made. Intended usability benefits are stated.	Recommendations are appropriate solutions of specific changes that should be made. Theory-based justification of usability benefits is present.
